Common (may affect up to 1 in 10 people):
- lethargy
- shakiness or tremor
- diarrhoea
- constipation
- tiredness
- feeling dizzy or faint when you stand up suddenly (orthostatic hypotension)
- vivid dreams
- feeling anxious
- pain in your joints (arthralgia) or muscles (myalgia)

Uncommon (may affect up to 1 in 100 people):
- abnormal sensation in the skin e.g. burning, stinging, tickling or tingling (paresthesia)
- restless legs
- low blood pressure
- feeling agitated
- urge to move

Rare (may affect up to 1 in 1,000 people):
- inflammation of the pancreas, which causes severe pain in the abdomen and back
- muscle twitching or contractions (myoclonus)
- aggression

Not known (frequency cannot be estimated from the available data):
- difficulty with speaking
- abnormal sensations in the mouth (oral paraesthesia)
- swelling in the mouth (mouth oedema), increase in saliva secretion or watery mouth
- an excess of anti-diuretic hormone in the body resulting in low blood levels of sodium which can cause tiredness and confusion, muscle twitching, fits and coma
- sleepwalking (somnambulism)
- swelling throughout the body (generalised oedema)
- faecalised swelling
- increased creatinine kinase blood levels
- difficulty in passing urine (urinary retention)
- muscle pain, stiffness and/or weakness, darkening or discolouration of the urine (rhabdomyolysis)

Additional side effects in children and adolescents
In children under 18 years the following adverse events were observed commonly in clinical trials: significant weight gain, hives and increased blood triglycerides.

Reporting of side effects
If you get any side effects, talk to your doctor or pharmacist. This includes any possible side effects not listed in this leaflet. You can also report side effects directly via the Yellow Card Scheme at www.mhra.gov.uk/yellowcard. By reporting side effects you can help provide more information on the safety of this medicine.

5) How to store Mirtazapine tablets
Keep out of the sight and reach of children.
This medicinal product does not require any special storage conditions. Store in the original package.
Do not use Mirtazapine tablets after the expiry date, which is stated on the carton. The expiry date refers to the last day of that month.
Medicines should not be disposed of via wastewater or household waste.
Ask your pharmacist how to dispose of medicines no longer required. These measures will help to protect the environment.

6) Contents of the pack and other information
What Mirtazapine tablets contain
- The active ingredient is Mirtazapine. Each film coated tablet contains 15, 30 or 45 mg Mirtazapine.
- The other ingredients are lactose monohydrate, maize starch, hydroxypropyl cellulose, low substituted hydroxypropyl cellulose, magnesium stearate (E470b), silica colloidal anhydrous, hypromellose (E464) and titanium dioxide (E 171).
- The 15 mg tablets also contain yellow iron oxide (E172).
- The 30 mg tablets also contain yellow iron oxide (E172), red iron oxide (E172) and black iron oxide (E172).
- The 45 mg tablets also contain yellow iron oxide (E172), red iron oxide (E172) and black iron oxide (E172).

What Mirtazapine tablets look like and contents of the pack
Mirtazapine 15 mg tablets are yellow, biconvex, capsule shaped film coated tablets with score line on one side and 15 embossed on other side.
Mirtazapine 30 mg tablets are reddish brown, biconvex, capsule shaped film coated tablets with score line on one side and 30 embossed on other side.
Mirtazapine 45 mg tablets are white, biconvex, capsule shaped film coated tablets plain on one side and 45 embossed on other side.
Mirtazapine 15, 30 and 45 mg tablets are available in PVC coated PVD blister packs of 10/14/28/30/40/50/56/60/10/84/90/100/200/250/500 tablets. Not all packs may be marketed.

PACKAGE LEAFLET: INFORMATION FOR THE USER
Mirtazapine 15, 30 & 45 mg tablets
(Mirtazapine)

Read all of this leaflet carefully before you start taking this medicine because it contains important information for you.
- Keep this leaflet. You may need to read it again.
- If you have any further questions, ask your doctor or pharmacist.
- This medicine has been prescribed for you. Do not pass it on to others. It may harm them, even if their signs of illness are the same as yours.
- If you get any side effects, talk to your doctor or pharmacist. This includes any possible side effect not listed in this leaflet. See section 4.

What is this in this leaflet
1) What Mirtazapine tablet is and what it is used for
2) What you need to know before you take Mirtazapine tablets
3) How to take Mirtazapine tablets
4) Possible side effects
5) How to store Mirtazapine tablets
6) Contents of the pack and other information

1) What Mirtazapine tablet is and what it is used for
Mirtazapine is one of a group of medicines called antidepressants. Mirtazapine tablets are used to treat depressive illness.

2) What you need to know before you take Mirtazapine tablets
Do not take Mirtazapine tablets
- if you are allergic (hypersensitive) to mirtazapine or any of the other ingredients of Mirtazapine tablets.
- if you are taking or have recently taken (within the last two weeks) medicines called monoamine oxidase inhibitors (MAO-I).

Warnings and precautions
Talk to your doctor or pharmacist before taking Mirtazapine tablets.

Children and adolescents
Mirtazapine should normally not be used for children and adolescents under 18 years because efficacy was not demonstrated. Also, you should know that patients under 18 have an increased risk of side-effects such as suicide attempt, suicidal thoughts and hostility (predominantly aggression, oppositional behaviour and anger) when they take this class of medicines. Despite this, your doctor may prescribe Mirtazapine for patients under 18 because he/she decides that this is in their best interests. If your doctor has prescribed Mirtazapine for a patient under 18 and you want to discuss this, please go back to your doctor. You should inform your doctor if any of the symptoms listed above develop or worsen when patients under 18 are taking Mirtazapine.

Also, the long-term safety effects concerning growth, maturation and cognitive and behavioural development of Mirtazapine in this age group have not yet been demonstrated. In addition, significant weight gain has been observed in this age category more often when treated with Mirtazapine compared with adults.

Thoughts of suicide and worsening of your depression
If you are depressed you can sometimes have thoughts of harming or killing yourself. These may be increased when first starting antidepressants, since these medicines all take time to work, usually about two weeks but sometimes longer.
You may be more likely to think like this:
- if you have previously had thoughts about killing or harming yourself;
- if you are a young adult. Information from clinical trials has shown an increased risk of suicidal behaviour in adults aged less than 25 years with psychiatric conditions who were treated with an antidepressant.
- if you have thoughts of harming or killing yourself at any time, contact your doctor or go to a hospital straight away.

You may find it helpful to tell a relative or close friend that you are depressed, and ask them to read this leaflet. You might ask them to tell you if they think your depression is getting worse, or if they are worried about changes in your behaviour.

Also take special care with Mirtazapine
- if you have, or have ever had one of the following conditions:
  - tell your doctor about these conditions before taking Mirtazapine, if not done previously.
  - tell your doctor about these conditions before taking Mirtazapine, if not done previously.
  - seizures (epilepsy). If you develop seizures or your seizures become more frequent, stop taking Mirtazapine and contact your doctor immediately;
  - liver disease, including jaundice. If jaundice occurs, stop taking Mirtazapine and contact your doctor immediately;
  - kidney disease;
  - heart disease, or low blood pressure;
  - schizophrenia. If psychotic symptoms, such as paranoid thoughts become more frequent or severe, contact your doctor straight away;
  - manic depression (alternating periods of feeling elated/overactivity and depressed mood). If you start feeling elated or over-excited, stop taking Mirtazapine and contact your doctor immediately;
  - diabetes (you may need to adjust your dose of insulin or other antidiabetic medicines);
  - eye disease, such as increased pressure in the eye (glaucoma);
  - difficulty in passing water (urinating), which might be caused by an enlarged prostate;
  - certain kinds of heart conditions that may change your heart rhythm, a recent heart attack, heart failure, or take certain medicines that may affect the heart’s rhythm;
Mirtazapine 15, 30 and 45 mg tablets are available in PVC coated PVdC blister packs of side and 45 embossed on one side and 30 embossed on other side.

Take care when taking Mirtazapine in combination with:
- monoamine oxidase inhibitors (MAO inhibitors). Also, do not take Mirtazapine during the two weeks after you have stopped taking MAO inhibitors. If you stop taking Mirtazapine, do not take MAO inhibitors during the next two weeks either. Examples of MAO inhibitors are moclobemide, tranylcypromine (both are antidepressants) used for Parkinson's disease.

Examples of MAO inhibitors are moclobemide, tranylcypromine (both are antidepressants) used for Parkinson's disease.

Do not take Mirtazapine in combination with:
- antidepressants such as SSRIs, venlafaxine and L-tryptophan, or triptans (used to treat migraine), tramadol (a pain-killer), linezolid (an antibiotic), lithium (used to treat some psychiatric conditions) and St. John's Wort - Hypericum perforatum preparations (a herbal remedy for depression). In very rare cases Mirtazapine alone or the combination of Mirtazapine with these medicines, can lead to a so-called serotonin syndrome. Some of the symptoms of this syndrome are: inapplicable fever, sweating, increased heart rate, diarrhoea, (uncontrollable) muscle contractions, shivering, overactive reflexes, restlessness, mood changes, and unconsciousness. If you get a combination of these symptoms, talk to your doctor immediately.

the antidepressant nefazodone. It can increase the amount of Mirtazapine in your blood. Inform your doctor if you are using this medicine. It might be needed to lower the dose of Mirtazapine, or when use of nefazodone is stopped, to increase the dose of Mirtazapine again.

medicines for anxiety or insomnia such as benzodiazepines; medicines for schizoaffective such as chlorpromazine; medicines for allergies such as cetirizine; medicines for severe pain such as morphine.

In combination with these medicines Mirtazapine can increase the drowsiness caused by these medicines.

medicines for infections; medicines for bacterial infections (such as erythromycin); medicines for fungal infections (such as ketoconazole) and medicines for HIV/AIDS (such as HLVprotease inhibitors).

In combination with Mirtazapine these medicines can increase the amount of Mirtazapine in your blood. Inform your doctor if you are using this medicine. It might be needed to lower the dose of Mirtazapine, or when these medicines are stopped, to increase the dose of Mirtazapine again.

medicines for epilepsy such as carbamazepine and phenytoin; medicines for tuberculosis such as rifampicin.

In combination with Mirtazapine these medicines can reduce the amount of Mirtazapine in your blood. Inform your doctor if you are using this medicine. In case of combination it is advised that a doctor monitors your blood carefully.

medicines that may affect the heart's rhythm such as certain antiarrhythmics and some antipsychotics.

Mirtazapine tablets with food and alcohol
You may get drowsy if you drink alcohol while you are taking Mirtazapine. You are advised not to drink any alcohol. You can take Mirtazapine tablets with or without food.

Pregnancy and breast feeding
If you are pregnant or breast-feeding, think you may be pregnant or are planning to have a baby, ask your doctor or pharmacist for advice before taking this medicine. Limited experience with Mirtazapine administration to pregnant women does not indicate an increased risk. However, caution should be exercised when used during pregnancy. If you use Mirtazapine tablets until, or shortly before birth, your baby should be supervised for possible adverse effects. Ask your doctor whether you can breast-feed, while taking Mirtazapine tablets.

Mirtazapine tablets contain lactose
Mirtazapine film-coated tablet contains lactose. If you have been told by your doctor that you have an intolerance to some sugars, contact your doctor before taking this medicinal product.

How to take Mirtazapine tablets
Always take Mirtazapine tablets exactly as your doctor or pharmacist has told you. Check with your doctor or pharmacist if you are not sure.

How much to take
The recommended starting dose is 15 or 30 mg every day. Your doctor may advise you to increase your dose after a few days to the amount that is best for you (between 15 and 45 mg per day). The dose is usually the same for all ages. However, if you are an elderly person or if you have renal or liver disease, your doctor may adapt the dose.

When to take Mirtazapine tablets
Take Mirtazapine tablets at the same time each day. It is best to take Mirtazapine tablets as a single dose before you go to bed. However your doctor may suggest to split your dose of Mirtazapine tablets – once in the morning and once at night time before you go to bed. The higher dose should be taken before you go to bed.

Take your tablets orally. Swallow your prescribed dose of Mirtazapine tablets without chewing, with some water.

When can you expect to start feeling better
Usually Mirtazapine tablets will start working after 1 to 2 weeks and after 2 to 4 weeks you may start to feel better.

It is important that, during the first few weeks of the treatment, you talk with your doctor about the effects of Mirtazapine tablets:

4) Possible side effects
Like all medicines, Mirtazapine tablets can cause side effects, although not everybody gets them.

Serious side effects – STOP TAKING Mirtazapine and see a doctor straight away if you:
- have blisters of the skin (dermatitis bullous)
- have skin rash, which may blister, and looks like small targets (central dark spots surrounded by a paler area, with a dark ring around the edge) called erythema multiforme
- have a widespread rash with blisters and peeling skin, particularly around the mouth, nose, eyes and genitals (Stevens-Johnson syndrome)
- have a widespread rash with blisters and skin peeling on much of the body surface (toxic epidermal necrolysis)
- have thoughts of harming or killing yourself
- have an epileptic attack (convulsions)
- have a combination of symptoms such as inapplicable fever, sweating, increased heart rate, diarrhoea, (uncontrollable) muscle contractions, shivering, overactive reflexes, restlessness, mood changes and unconsciousness. In very rare cases these can be signs of a serotonin syndrome
- feel like you are elated or emotionally ‘high’ (mania)
- have yellow colouring of eyes or skin; this may suggest disturbance in liver function (jaundice)
- have signs of infection such as sudden unexplainable high fever, sore throat and mouth ulcers (agranulocytosis). In rare cases mirtazapine can cause disturbances in the production of blood cells (bone marrow depression). Some people become less resistant to infection because mirtazapine can cause a temporary shortage of white blood cells (granulocytopenia). In rare cases mirtazapine may also cause a shortage of red and white blood cells, as well as blood platelets (aplasic anemia), a shortage of blood platelets (thrombocytopenia) or an increase in the number of white blood cells (eosinophilia). A blood test may be required.

Other possible side effects with Mirtazapine are:
Very common (may affect more than 1 in 10 people):
- increase in appetite and weight gain
- drowsiness or sleepiness
- headache
- dry mouth
